

■ Product Price Tracker - User Guide

The Dual Site Price Tracker is an advanced Python desktop application that helps users compare product prices between Amazon and Flipkart in real time. With an elegant GUI built using CustomTkinter, users can fetch product details, track price changes, receive notifications (desktop & email), and manage tracked products efficiently.

1. Installation

- Ensure you have Python 3.11+ installed on your system.
- Install dependencies using: `pip install -r requirements.txt`
- Make sure Google Chrome and ChromeDriver are correctly set up for web scraping.

2. Launching the App

- Run the main script: `python main.py`
- The application window will open with a modern light-blue interface.

3. Fetching Product Details

- Navigate to the Home page.
- Enter Amazon and Flipkart product URLs in respective fields.
- Click 'Fetch' to retrieve name and current price for each site.
- Product details will appear under each platform.

4. Starting Price Tracking

- Enter your email address for alerts.
- Click '■ Start Price Tracking' to save and start monitoring.
- The app will compare both site prices every 30 minutes (default).
- Notifications are sent when price drops occur.

5. CSV Upload Feature (Dashboard)

- Go to Dashboard from the sidebar.

- Click 'Choose CSV File' and upload a .csv file with Amazon & Flipkart URLs.
- The system will automatically fetch details for all products in background.
- Click '■ Start Tracking Price' to start tracking all CSV products.

6. Settings Page

- Change app language, notification preferences, and sound alerts.
- Adjust tracking frequency (5 min to 1 day).
- Export tracked products to Excel.
- Remove specific products from tracking list.

7. Notifications & .env Setup

- To enable email alerts, create a .env file with your Gmail credentials:
- EMAIL_ADDRESS=your-email@gmail.com
- EMAIL_PASSWORD=your-app-password
- SMTP_SERVER=smtp.gmail.com
- SMTP_PORT=587
- App passwords must be created via Google account settings (requires 2-step verification).

8. Error Handling

- If you see 'No module named ...', install the missing dependency using pip.
- If Gmail login fails, use an App Password instead of your main password.
- Logs for issues are saved in the 'logs/' directory.

9. Exiting the Application

- Click the window close button or use the 'Exit' option to terminate safely.
- All scheduled tasks are stopped automatically.

10. Security

- Passwords hashed with SHA-256.
- Email credentials stored securely in .env.
- JWT tokens used for local session handling.
- Input validation to prevent data corruption.

11. Future Enhancements

- **AI-Driven Price Prediction**

Integrate machine learning models to analyze historical price trends and predict upcoming price drops.

Provide users with a “Best Time to Buy” recommendation based on these predictions.

- **Cloud Synchronization**

Allow users to sync their tracking data to cloud services like Firebase or AWS DynamoDB.

Enable cross-device tracking and centralized account management.
